

RihlAI

Multi-Agent Startup Analysis Report

AI-Powered Morocco Tourism Platform • WC2030 Context

5-Agent Independent Analysis System

May 2026

The Idea in One Sentence: RihlAI is an AI-powered Morocco tourism platform targeting the 6+ million visitors expected for WC2030, combining a curated local-spots database, multilingual AI chat, a rarity-scoring system, camera-based monument/dish identification, team-based itinerary planning, and a marketplace for local Moroccan businesses.

Context: The Business Idea

The Problem

Morocco's best tourism spots are scattered across six host cities with no single trusted source of discovery. International tourists face a compounded set of friction points:

- **Information fragmentation** — no single authoritative platform for Moroccan tourism
- **Language barrier** — most high-quality content is in Arabic or French, inaccessible to many visitors
- **Shallow AI tools** — generic travel apps do not understand Moroccan culture, Darija, or local context deeply
- **Hidden gems problem** — tourists miss undiscovered local experiences due to poor discovery tools
- **No local economy integration** — spending defaults to international chains rather than supporting local artisans, guides, and restaurants

The WC2030 Opportunity

Morocco co-hosts the 2030 FIFA World Cup alongside Spain and Portugal. The six Moroccan host cities are: **Casablanca, Rabat, Tangier, Marrakech, Agadir, and Fez**. This creates a forced, time-boxed demand spike of 6 million+ international tourists arriving in a compressed window.

The Solution: RihlAI

RihlAI is structured around five core product pillars:

1. **AI Chat (multilingual RAG)** — LLM over a curated Morocco spots database, responding in any language, auto-detecting from browser locale
2. **Rarity Score System** — ranks spots by an “undiscovered vs. popular” index (the AI-scored rarity index), surfacing hidden gems over tourist traps
3. **Camera Identification** — point phone at a monument or dish and receive instant AI identification and cultural story

4. **Team-Based Itinerary** — select your national football team and receive a 3-day itinerary around your match city, timed around kickoff
5. **Local Business Marketplace** — Moroccan artisans, guides, and restaurants get a profile; tourists discover them, spend locally, support the economy

The Database Moat

The founders identify the curated spots database as RihlAI's core defensible asset, built by scraping TripAdvisor, Google Places, travel blogs, and Reddit, then manually enriched with content not indexed in English or any major language. The thesis: *“that database is what makes RihlAI irreplaceable.”*

Business Model Canvas Summary

Table 1: RihlAI Business Model Canvas (condensed)

Key Partners	Key Activities	Value Proposition	Customer Segments
Moroccan Ministry of Tourism FIFA/WC2030 committee Local hospitality & riads Royal Air Maroc OpenAI / Google APIs Artisan cooperatives	AI model training & tuning Moroccan data curation Platform development Local business onboarding Marketing to WC visitors	One app for every Moroccan tourism need AI that speaks your language Discover what locals love Real-time translation Supports local economy	International WC2030 tourists Football fans Cultural & adventure travelers Local businesses (B2B) Post-WC general tourists
Key Resources	Channels	Customer Relationships	Revenue Streams
AI/ML infrastructure Curated Morocco database Mobile app (iOS + Android) Multilingual content team	App Store / Play Store WC fan zones & airports Social media / influencers Airlines partnerships QR codes at stadiums	AI-powered personalisation Community reviews & tips In-app support chatbot	Premium subscription Local business listing fees Commission on bookings Sponsored placements B2B white-label Data insights (hospitality)
Cost Structure: AI API costs, cloud infrastructure, mobile development, data curation, marketing, multilingual support		Revenue: Freemium → Premium subscriptions, B2B licensing, marketplace commissions	

Agent 1: The Venture Capitalist

Persona: Skeptical, numbers-driven, pattern recognition

6.5 / 10

Focus: Scalability, ROI, market size, defensibility

How They Understand the Idea

A geo-specific AI travel app riding a massive, time-boxed demand spike — WC2030 — with a marketplace layer attached. The event creates a forced distribution window that most startups would kill for. The real investment question is whether the curated database becomes a defensible moat or just a feature any well-resourced incumbent could replicate in six months.

Strengths

- **[+]** 6 million+ captive tourists arriving for WC2030 — pre-validated demand
 - **[+]** Clear time-boxed go-to-market: the event is the launch
 - **[+]** Marketplace creates recurring revenue after the event ends
 - **[+]** Multilingual database moat if data is deep and genuinely unlisted elsewhere
 - **[+]** Multiple revenue streams across B2C and B2B
 - **[+]** Natural virality via team-based itinerary and social sharing mechanics
-

Weaknesses and Risks

- **[-]** Total addressable market shrinks sharply after July 2030
- **[-]** Google Maps and TripAdvisor can replicate core features rapidly
- **[-]** Data moat unproven — scraping is not proprietary and may be legally challenged
- **[-]** Unit economics of the local business marketplace are unclear
- **[-]** Retention and monetisation post-event are entirely unvalidated

- **[-]** No stated institutional partnership (Ministry, FIFA) confirmed
-

Key Assumptions That Must Be True

- **[?]** Tourists actively seek local, non-Google alternatives when visiting Morocco
 - **[?]** The database quality is genuinely superior to what incumbents offer
 - **[?]** Local businesses will pay for platform listings after the WC ends
 - **[?]** Morocco tourism remains strong and growing in the post-2030 period
 - **[?]** A team can be assembled with the skills to build all five product pillars before 2030
-

What They Would Change or Improve

- **[→]** Reframe the pitch as a “Morocco Tourism OS” not a travel app. Position for B2B licensing to the Ministry of Tourism, Royal Air Maroc, and FIFA’s official WC2030 infrastructure first. That is a fundable, defensible angle with contractual revenue secured before launch.
 - **[→]** Secure a Letter of Intent from at least one official WC2030 institutional partner before raising capital. This removes the event-risk objection instantly.
 - **[→]** Quantify the moat: define precisely what percentage of the database cannot be found on Google in English, Arabic, or French. That number is your entire investment thesis — make it concrete.
 - **[→]** Model post-event unit economics explicitly. Show that 10,000 paying local businesses at 200 MAD/month creates a sustainable base regardless of tourist volumes.
-

Rating Justification

6.5 / 10. Strong concept with a rare and real distribution window. Loses points for soft defensibility, unproven post-event retention, and no confirmed institutional anchor. Would want a clearer B2B revenue story and one signed partnership before committing capital.

Agent 2: The Product Manager

Persona: Practical, user-first, iterative

7.5 / 10

Focus: User experience, product-market fit, usability

How They Understand the Idea

RihlAI is solving a real, friction-heavy problem: a tourist standing in a Marrakech souk at 10pm who does not speak Arabic, does not know what is halal or authentic, and cannot trust Google's results because they surface sponsored hotel chains. The camera-scan feature and team-based itinerary are genuinely differentiated. However, the MVP as described is dangerously broad — shipping five features simultaneously is shipping four too many.

Strengths

- **[+]** Real, specific, observable pain point — not manufactured by the founders
 - **[+]** Camera-to-identification is a killer single feature that could anchor the entire app
 - **[+]** “Select your team” itinerary mechanic is inherently viral and shareable
 - **[+]** Language auto-detection removes onboarding friction at the most critical moment
 - **[+]** Rarity score is a compelling, honest discovery hook that builds trust
-

Weaknesses and Risks

- **[-]** Too many features in v1 — focus is lost, quality will suffer across all five pillars
- **[-]** Marketplace + AI chat + camera + itinerary planner = four distinct products, not one
- **[-]** No user research cited anywhere — all assumptions are untested by the founders

- [-] Business onboarding UX for local artisans and restaurants is completely undefined
 - [-] Offline mode is critical for Morocco’s connectivity gaps but not mentioned in the plan
 - [-] Rarity score definition is vague — how is it calculated? What data signals? Who decides?
-

Key Assumptions That Must Be True

- [?] Tourists will download a destination-specific local app rather than relying on Google Maps
 - [?] Camera feature works reliably on both Moroccan monuments and food dishes across lighting conditions
 - [?] Local business owners have smartphones and can self-list with minimal friction
 - [?] The rarity score feels trustworthy and authentic to users, not gamified or manipulable
-

What They Would Change or Improve

- [→] Kill three features. The MVP should be: multilingual AI chat + rarity-scored spots database. Nothing else. Validate those two core elements work before adding camera, marketplace, or itinerary.
 - [→] Run five in-person user tests this week with real tourists in Jemaa el-Fna or the Casablanca Corniche. Watch how they actually navigate a new city. Your assumptions will shatter and rebuild in one afternoon.
 - [→] Define the rarity score algorithm precisely before building. It should be transparent to users (“only 3% of tourists have visited this place”) not a black box.
 - [→] Design offline-first from day one. Morocco’s 4G coverage outside major medinas is inconsistent, and the app must function with cached city data.
-

Rating Justification

7.5 / 10. Strong product-market fit signal on the core problem, with genuinely novel mechanics. The camera feature and team itinerary are real differentiators. Loses points for feature sprawl, absence of stated user research, and undefined offline strategy.

Agent 3: The Technical Architect

Persona: Analytical, systems-thinking

6.0 / 10

Focus: Feasibility, technical complexity, system scalability

How They Understand the Idea

The proposed tech stack is directionally sound. LLM + RAG over a curated vector database is the correct architecture for this use case, and it is proven technology that can be assembled in 2026. However, three complex subsystems — computer vision for camera identification, a RAG pipeline with multilingual support, and an itinerary planning engine — each carry significant build complexity. The hardest part is not the AI: it is the data pipeline. Scraping TripAdvisor at scale will trigger legal challenges and technical rate-limiting immediately.

Strengths

- **[+]** RAG + LLM is a proven, buildable architecture with good tooling available today
 - **[+]** Language auto-detection is trivial using standard browser locale APIs
 - **[+]** Rarity score is computable from existing data signals (review counts, photo counts, check-ins)
 - **[+]** Modular design is possible — camera feature can be an independent v2 microservice
 - **[+]** Vector databases (Pinecone, Weaviate) make multilingual semantic search tractable
-

Weaknesses and Risks

- **[-]** Scraping TripAdvisor and Google Places violates their Terms of Service — legal exposure before launch

- **[-]** Camera identification of Moroccan dishes and architecture requires a fine-tuned vision model, not an off-the-shelf API
 - **[-]** Manual database enrichment for content not in English or Arabic is a human-bottleneck that cannot be automated away
 - **[-]** RAG latency on mobile in low-connectivity Moroccan environments is a real UX problem
 - **[-]** Keeping the database fresh (new openings, closures, price changes) is an ongoing operational cost
 - **[-]** 6 million concurrent users at peak WC2030 requires serious infrastructure planning from day one, not post-launch
-

Key Assumptions That Must Be True

- **[?]** A fine-tuned vision model can reliably identify Moroccan dishes and architectural styles under variable lighting
 - **[?]** Data can be legally sourced via APIs and partnerships rather than scraping
 - **[?]** The team simultaneously has ML engineering, backend, and mobile development expertise
 - **[?]** Infrastructure can be designed to handle WC2030 peak traffic without performance degradation
-

What They Would Change or Improve

- **[→]** Negotiate data partnerships with the Google Places API (free tier), Foursquare Places API, and the Moroccan Ministry of Tourism directly. Cleaner, legal, faster to enrich, and creates a relationship that competitors cannot easily replicate.
- **[→]** Build the camera feature as a completely independent microservice decoupled from the core RAG pipeline. Build and validate it independently on a 6-month parallel track, not as part of the MVP.
- **[→]** Implement aggressive caching and pre-downloaded city bundles. For each of the six host cities, cache the top 300 spots with full AI responses so the app functions at 2G speeds. This is table stakes for a tourist audience.

- **[→]** Plan for traffic spikes from day one using auto-scaling cloud infrastructure. A WC2030 group stage match day could drive 50x normal traffic in hours.
-

Rating Justification

6.0 / 10. Technically feasible with the right team, but the data pipeline legal risks and the complexity of the vision model are significantly underestimated. The camera feature alone could consume six months of ML engineering work. A strong technical architecture decision is needed from week one, not week twenty.

Agent 4: The Marketing Strategist

Persona: Creative but data-aware

8.0 / 10

Focus: Positioning, acquisition channels, branding, growth

How They Understand the Idea

The positioning writes itself: “*Morocco, as locals know it.*” The timing is extraordinary — WC2030 is a once-in-a-generation distribution event that creates a captive, high-intent audience the size of a medium European country. The “select your team, get your itinerary” mechanic is inherently shareable and perfectly calibrated for football social media culture. The primary marketing challenge is not awareness during the event — it is trust-building and pre-download conversion *before* tourists board their flights.

Strengths

- **[+]** Built-in viral mechanic: team-based itineraries are designed for social sharing
 - **[+]** Clear, physical acquisition channels: airports, fan zones, QR codes at stadiums, partner airlines
 - **[+]** WC2030 global media coverage creates a massive earned PR opportunity at zero cost
 - **[+]** “Hidden gems” positioning is a strong, honest differentiation versus Google’s sponsored results
 - **[+]** Creator economy angle: travel YouTubers and TikTokers actively seek “local secrets” content
 - **[+]** Football team tribalism is powerful — every nation’s fan base is a pre-built community
-

Weaknesses and Risks

- **[-]** No pre-event brand building strategy is stated — you cannot launch an unknown app into WC2030 without 18 months of brand work ahead of it
 - **[-]** App store discovery across 5+ languages and 32+ national markets is complex and expensive
 - **[-]** Trust gap: why should a French or Brazilian tourist trust RihlAI over Google Maps? This needs an explicit answer
 - **[-]** Post-WC brand relevance is undefined — what is RihlAI's identity when there is no World Cup?
-

Key Assumptions That Must Be True

- **[?]** Tourists will install a destination-specific app before or immediately upon arrival
 - **[?]** QR codes at fan zones and stadiums drive meaningful, sustained installs rather than curiosity clicks
 - **[?]** The “local knowledge” brand positioning can out-compete the brand recognition of Google and TripAdvisor
-

What They Would Change or Improve

- **[→]** Launch a “Hidden Morocco” content campaign 18 months before WC2030 on TikTok and YouTube. Build the database and the audience simultaneously. Content becomes the acquisition flywheel: every video brings qualified, high-intent future tourists into the top of the funnel.
- **[→]** Partner with 10 to 15 national football federation official travel pages. When the French Football Federation publishes “how to travel to Morocco for WC2030,” RihlAI should be linked. That is millions of targeted, genuinely high-intent users at zero acquisition cost.
- **[→]** Create a Moroccan Diaspora Ambassador programme targeting Moroccan communities in France, Spain, Belgium, the Netherlands, and Canada. Diaspora communities are the most trusted Morocco travel guides for their networks, and they are already deeply engaged with WC2030 sentiment.

- **[→]** Design the team itinerary feature to generate a shareable image card (like Spotify Wrapped). “My 3 days in Fez for Morocco vs Brazil” posted on Instagram is free advertising to thousands of pre-qualified tourists.
-

Rating Justification

8.0 / 10. The best marketing timing of any startup reviewed in recent years. The distribution window is massive, the viral mechanic is built into the product design, and the positioning against incumbent giants is credible. Loses two points for absence of a stated pre-event brand strategy and no defined post-WC brand identity.

Agent 5: The Skeptic / Critic

Persona: Brutally honest, contrarian
Focus: Risks, weaknesses, failure points

4.5 / 10

How They Understand the Idea

A well-dressed event-dependent travel app with a four-year runway to build something that matters for three months. The database is identified as the moat — but building it correctly, legally, and with sufficient depth to genuinely outperform Google requires a team, legal agreements, budget, and years of curation that are nowhere accounted for in the plan. The founders are betting on a single macro event they do not control, in a country where institutional support is required but not yet confirmed. Fifty startups with this structure have been reviewed. Most die when the event ends.

Strongest Objections

- **[-]** Google will ship a “Morocco World Cup mode” with curated hidden gems and real-time translation in 2029. What is your reason to exist when they do?
- **[-]** Hard event dependency: revenue and users drop off a cliff on July 14, 2030 unless the marketplace achieves strong independent traction first
- **[-]** Database quality depends on a multilingual content team that has not been hired and has no defined budget
- **[-]** Scraping TripAdvisor and Google Places violates ToS. The legal action or technical blocking could destroy the product before it launches
- **[-]** Ministry partnerships in Morocco move slowly and unpredictably. Waiting for an MOU could consume 18 months of the build window
- **[-]** Monetising Moroccan SMBs at scale is historically very difficult. The informal economy means many businesses cannot or will not adopt digital payment tools
- **[-]** There is no evidence in the market that international tourists download city-specific apps when Google Maps offline mode is free and universal

- **[−]** WC2030 is co-hosted with Spain and Portugal. Many tourists will not visit Morocco at all, or will spend only days there versus weeks in Madrid or Lisbon
-

The Hardest Question

If Google Maps adds a “hidden gems” tab, a Darija translation layer, and a “WC2030 Morocco” curation filter in 2029 — which it absolutely can, at zero marginal cost relative to its existing infrastructure — what is your reason to exist? This question must have three concrete, specific answers before a single line of code is written. “Because we are local” is not an answer.

What Would Change Their Mind

- **[→]** A signed MOU with the Moroccan Ministry of Tourism providing exclusive data access and official endorsement
 - **[→]** Demonstrated marketplace traction: 1,000 paying local businesses listing on the platform before the app launches
 - **[→]** Behavioural data showing that tourists currently in Morocco actually use local apps instead of or alongside Google Maps
 - **[→]** A credible post-WC revenue model that generates sustainable income without needing 6 million tourists per year
-

Rating Justification

4.5 / 10. The idea has a real kernel and the timing is genuine. But it is currently a bet on one event, in one country, against incumbents with vastly more resources, built on a database whose legal foundation is shaky. Without resolving the Google defensibility question and the post-event revenue model, this is a high-risk tourism startup wearing an AI costume.

Cross-Agent Synthesis

Key Areas of Agreement

All five agents independently converged on the following points:

1. **The curated spots database is the single most important asset.** Every agent flags it as the real moat and the hardest thing to build. It is simultaneously the strongest and most fragile element of the plan.
2. **WC2030 timing creates a genuine, time-limited opportunity.** There is consensus that the event creates a forced distribution window that is rare and real — this is not manufactured demand.
3. **Legal data sourcing is non-negotiable.** Scraping TripAdvisor is not a viable path. All technical and VC agents flag this as an existential legal risk.
4. **The post-WC strategy is the existential question.** Every agent independently identifies the post-event cliff as the most important strategic challenge to solve before building.
5. **The “select your team” itinerary mechanic has genuine viral potential.** The PM and Marketing agent both cite it independently as the standout product feature.

Major Disagreements

Table 2: Key disagreements between agents

Topic	One Side	Other Side
Feature scope for MVP	PM: Kill four features. Ship only AI chat + rarity database. Nothing else.	Marketing: The camera feature and team mechanic ARE the marketing. Cutting them removes the viral hooks.
Fundability today	VC (6.5/10): Needs a B2B anchor and an official institutional partnership before it is fundable.	Marketing (8.0/10): Best-timed startup in years. The window is the pitch. Fund it and build fast.
Defensibility against Google	Skeptic: Google will replicate the core features in 2029. No sustainable moat exists.	VC: A deep Arabic/Darija/Amazigh data layer covering content Google won't bother with at scale is defensible.
Database build strategy	Tech Architect: Legal API partnerships with Google Places, Foursquare, and Ministry of Tourism.	Founders' plan: Scraping TripAdvisor, Google Places, and travel blogs + manual enrichment.

Top 5 Critical Risks

Risk 1 — The Google Problem

Google Maps adds “WC2030 Morocco” curated content, local language support, and hidden gems filters in 2029. Tourists use it by default because it is already installed. RihlAI has no pre-existing distribution advantage and no brand recognition to overcome this. **Severity: Critical. Probability: High.**

Risk 2 — The Post-Event Cliff

Revenue and user acquisition drop sharply after July 2030 unless the local business marketplace achieves strong, independent traction before the event ends. The platform cannot sustain itself on Morocco's ordinary tourism volumes alone without a fundamentally different business model. **Severity: Critical. Probability: High.**

Risk 3 — Database Quality and Legal Foundation

Scraping TripAdvisor and Google Places violates their Terms of Service and could result in legal action, IP blocks, or takedown notices before launch. Manually curating six cities to genuine depth requires a content team and budget that are not accounted for in the current plan. **Severity: High. Probability:**

High.

Risk 4 — Tourist Acquisition Behaviour

There is no evidence in the market that international tourists download destination-specific apps when Google Maps offline mode is free, universal, and already trusted. The entire B2C acquisition model rests on this unvalidated assumption. **Severity: High. Probability: Medium.**

Risk 5 — Feature Overreach Before Launch

Attempting to ship camera AI identification, team itinerary planning, multilingual RAG, and a two-sided marketplace simultaneously will result in a mediocre product across all dimensions rather than excellence in one. A mediocre product in a one-event window does not get a second chance. **Severity: Medium. Probability: High.**

Top 5 Biggest Opportunities

Opportunity 1 — B2B White-Label Licensing to Tourism Boards and Airlines

Sell the AI database and query layer as a licensed API to Morocco's Ministry of Tourism, Royal Air Maroc, and potentially FIFA's official WC2030 app. Licensing fees generate contractually secured revenue that dwarfs B2C subscriptions and provides the institutional relationship that removes the Google defensibility concern.

Opportunity 2 — The WC2030 Global Media Moment

Every travel journalist covering WC2030 will write at least one piece titled "How to explore Morocco like a local." RihlAI, with a solid product and a strong PR push, becomes the default recommendation in those articles. That is tens of millions of dollars of earned media at zero cost.

Opportunity 3 — Becoming Critical Local Economy Infrastructure

If 50,000+ local artisans, guides, and restaurants acquire paying customers through RihlAI, the platform becomes critical economic infrastructure. Businesses do not leave a platform that generates their income. This creates post-event stickiness that is qualitatively different from a tourism app.

Opportunity 4 — Expanding to All Three WC2030 Host Countries

Spain and Portugal are co-hosts with dozens of participating cities. The same product architecture, applied to authentic local discovery in Seville, Porto, and Valencia, makes RihlAI a “WC2030 Travel Platform” with a market three times larger. This is fundable as a global play, not a Morocco-only play.

Opportunity 5 — Building the World’s First Arabic-First AI Tourism Database

There is no high-quality, Arabic-first, Darija-aware tourism database in existence. Building it creates an asset with value far beyond Morocco or WC2030 — it becomes the foundation for Arabic-language AI travel applications across the MENA region, a market of 400 million people.

Verdict

Verdict: YES — with conditions

The idea is worth pursuing if the following three conditions are met before significant capital is deployed:

1. The team commits to legally sourcing data through API partnerships and institutional agreements rather than scraping
2. The MVP is ruthlessly scoped to one or two core features with genuine excellence rather than five features with mediocre execution
3. A B2B licensing deal or official partnership is secured with at least one institutional partner (Ministry, Royal Air Maroc, or a WC2030 body) before major build investment begins

The WC2030 window is real, rare, and time-sensitive. The idea deserves to be built — but only correctly.

If the defensibility question and post-WC revenue model cannot be resolved within 90 days, consider these pivots:

Pivot A — Morocco Tourism OS (pure B2B SaaS): Sell the AI database as an API to hotels, tour operators, airlines, and the Ministry. Zero consumer marketing cost. Defensible through contracts, not brand. Immediately fundable.

Pivot B — “Hidden Morocco” media brand first: Build the content and audience on TikTok and YouTube, organically, around authentic Moroccan travel storytelling. Launch the app in 2028 into a captive, pre-built audience. Removes the cold-start acquisition problem entirely.

Pivot C — All-Three-Countries WC2030 Platform: Expand the scope to Morocco, Spain, and Portugal and pitch as “the” WC2030 travel platform. Tripled TAM, broader fundability, same core technology, reduced single-event risk.

Actionable Next Steps

Seven Concrete Next Steps

Step 1 (Do This First) — Test tourist download behaviour

Go to Jemaa el-Fna or any major tourist area this week. Ask 20 foreign tourists a single question: “When you arrived in Morocco, did you download a local app, or did you just use Google Maps?” Record their answers. This either validates or invalidates your entire B2C acquisition model in four hours, at zero cost.

Step 2 — Build a no-code landing page with a live “hidden gems” list

Create a simple webpage listing 20 genuinely undiscovered spots in one city — Casablanca, Marrakech, or Tangier. Add a waitlist email signup. Run it for four weeks and measure organic traffic and conversion rate. This tests the core value proposition without writing a line of AI code.

Step 3 — Contact the Moroccan Ministry of Tourism this week

Request an exploratory meeting to discuss digital infrastructure for WC2030. Even a single conversation signals market appetite, creates a relationship that could yield an MOU, and transforms the fundraising story from “we plan to talk to the Ministry” to “we have been in conversations since 2026.”

Step 4 — Scope the database MVP legally

Identify three legal data sources: Google Places API (free tier), Foursquare Places API, and direct outreach to 50 local businesses in one city. Build a prototype database of 200 spots for one city — with full descriptions in three languages — before attempting to cover six cities.

Step 5 — Build a WhatsApp or Telegram AI chatbot as version zero

Before investing in a full mobile app, deploy an AI chatbot on WhatsApp that answers “what should I do in Marrakech?” in multiple languages. Zero App Store friction, immediate testability, real user feedback within days. This validates the LLM + RAG layer cheaply and generates testimonials.

Step 6 — Sign 10 local businesses as founding partners

Identify 10 local guides, artisans, or restaurants willing to be listed on the platform for free in exchange for feedback and a testimonial. This validates

business-side willingness to participate, gives real social proof for investor decks and press, and begins the marketplace before the tech is built.

Step 7 — Answer the Google question in writing

Write a one-page internal document with the title: “Why will a tourist in Morocco choose RihlAI over Google Maps in 2030?” Force three concrete, specific answers — not vague positioning statements. This document becomes the defensibility section of every investor pitch deck and every partnership proposal.

Priority Framework: Highest Impact, Lowest Effort

Do Steps 1 and 2 together, this week.

Combined time investment: approximately 5 hours over 5 days. Combined cost: zero. Combined information value: enormous. If tourists do not download local apps AND the landing page attracts no organic traffic over four weeks, the entire B2C model needs fundamental rethinking before a single line of code is written.

Steps 1 and 2 together answer: *“Is there a market that wants this?”* Everything else is execution.

The 90-Day Milestone

By the end of 90 days, the founders should have:

- Validated (or invalidated) tourist download intent through 20+ direct interviews
- A working WhatsApp chatbot with 100+ real users who have tried the product
- One institutional contact in the Moroccan Ministry of Tourism or a WC2030 body
- A legally sourced prototype database of 200 spots for one city in three languages
- A written, honest answer to the Google defensibility question

With these five deliverables, a pre-seed fundraiser can be approached with

confidence. Without them, raising capital on the idea alone carries substantial risk of building the wrong thing at scale.

This analysis was produced by a 5-agent independent review system.

Each agent evaluated the idea without influence from the others.

Ratings reflect risk-adjusted potential as of May 2026.
